

Make.com Lead Capture & Budget-Based Qualification Automation Suite

Prepared by Muhammad Mohsin · Make.com · Google Sheets · Gmail · Webhooks

1. Project Overview

Two plug-and-play Make.com automation templates that capture inbound leads from any web form via webhook, store them, qualify them by budget, and reply instantly with personalized HTML emails. The templates are built for non-technical small-business owners, who set everything up by editing **one configuration module** and connecting Google once.

2. Project Requirements

Requirement	Delivered
Scenario 1: Webhook → Google Sheets + instant welcome email	Built and tested end-to-end
Scenario 2: Webhook → Router that qualifies leads by budget and sends tailored emails	4 routes: High, Mid, Low, Fallback
True plug-and-play for beginners: authenticate once, no editing of module mappings	Single ⚙ CONFIG module per scenario
Resellable as digital products (clean, documented, error-free on import)	Renamed modules, notes, error handlers
Exportable .json blueprints with short setup walkthroughs	Export-ready; placeholders for buyer values

3. How It Was Built

Scenario 1: Webhook → Google Sheets + Instant Welcome Email

- **Receive New Lead:** custom webhook with a defined structure (name, email, phone, source).
- **Valid email filter:** only leads whose email contains “@” continue.
- **⚙ CONFIG:** Sheet ID, sheet name, business name and email subject in one place.
- **Save Lead to Sheet:** Sheets “Enter manually” mode mapped from CONFIG; timestamp and default source added by formula. Resume handler keeps the flow alive if the Sheet fails.
- **Send Welcome Email:** branded, inline-styled HTML email personalized with the lead’s name. Skip handler.

Scenario 1 after a successful live run, with Resume and Skip error handlers

Scenario 2: Webhook → Lead Qualification Router (Budget Tiers)

- **Receive New Lead** (name, email, phone, budget, service) and the same email filter.
- **CONFIG**: business name, HIGH_BUDGET_MIN (5000), LOW_BUDGET_MAX (1000), booking link.
- **Clean Budget Value**: converts form text such as “\$7,500” to the number 7500. A Resume handler sets the value to 0 for input like “not sure”, so the run never crashes.
- **Qualify by Budget** router with four labelled, tailored email routes:

Route	Condition	Email sent
High budget	Budget ≥ HIGH_BUDGET_MIN	Priority strategy call with booking button
Mid budget	LOW_BUDGET_MAX < budget < HIGH_BUDGET_MIN	Tailored proposal within 24 hours
Low budget	0 < budget ≤ LOW_BUDGET_MAX	Starter packages and options
Fallback	No other route matches (missing or invalid budget)	General follow-up email

4. Testing

Test payload	Expected result	Outcome
Lead with name, email, phone, source	Row added to Sheet + welcome email	Passed
Budget “\$7,500”	High route	Passed
Budget “\$2,500”	Mid route	Passed
Budget “\$500”	Low route	Passed
Budget “not sure”	Fallback route, no crash	Passed (after adding Resume → 0)

5. Key Features

- **Decoupled setup**: buyers edit one CONFIG module; thresholds change without touching filters.
- **No hardcoded accounts**: one Google connection, Sheet mapped by ID from CONFIG.
- **Fault tolerant**: validation filter, input cleaning, fallback route, and Resume/Skip handlers on every external module.
- **Self-documenting**: every module renamed and annotated with notes inside the Make editor.
- **Branded HTML emails**: responsive inline styling, personalized with name, service and business name.

6. Future Additions

Addition	Value
CRM sync (HubSpot, GoHighLevel, Pipedrive)	Create or update contacts and deals per budget tier
AI lead scoring (OpenAI / Claude)	Score intent from the message field, not budget alone
Slack / WhatsApp alerts for high-budget leads	Instant team notification for priority leads
Multi-step follow-up sequences	Automated nurture emails over several days
Lead logging in Scenario 2 + reporting dashboard	Track conversion by tier in Sheets or Looker Studio
Duplicate detection and data enrichment	Cleaner lists; company and location lookup

Stack: Make.com (Webhooks, Tools, Router, filters, fallback routes, Resume/Skip error handlers) · Google Sheets · Gmail · inline HTML email templates · JSON webhook payloads.
